Elevated Rack Guard

When your customers ask about workplace safety, give them our name.

Rack Guard Netting Systems

InCord custom safety netting systems for pallet racks are used in retail and in industry to protect stock from falling. Vertical applications include protection for the back on single rows, reserve storage protection in picking applications and in flue spaces for back-to-back racks. Horizontal applications include netting under pallet flow lanes in pick modules and under carton flow systems to catch boxes.

MezzNet™ Safety Systems

This manually operated safety gate system is a simple and economical solution for pallet drop off points on mezzanines. They are frequently utilized in pick module for drop off points as well as for empty pallet/tote return lanes. MezzNet is easily operated from the floor by any employee and allowing unrestricted access to the loading area.

Horizontal Rack Guards

The Under Pallet Flow 3 Deep System installs under tracks to catch loose products. The Pallet Flow System is designed to catch product and personnel. Both systems will allow full access to pallets or cartons providing protection to goods and workers.

BayNets™

Easy to use and cost effective solution for floor opening protection in vehicle maintenance, machine and associated pits. Where pit access is needed, BayNets slides open along cabled tracks.

Conveyor Guards

Used underneath and around virtually every type of conveyor application including belt, roller and overhead systems. Our custom guards are excellent choices for monorail and tilt tray sortation systems as well as garment or "slick-rail" conveyors in distribution and laundry applications. The lightweight netting use in conveyor guard systems will protect workers below and offer a "soft-catch" which will reduce product damage versus metal guards.

CartNet™

Protects merchandise from falling during transportation. These reusable nets eliminate the need for shrink wrapping and its associated costs for both materials and recycling. Only a few uses are needed to realize savings.

Elevated Rack Guard

The InCord Elevated Rack Guard is an easy to operate vertical gate safety system designed to protect elevated rack loading and storage areas. Using a simple rope pull, the ERG can be opened and closed from the floor below. Installed between the columns and cross beams of two bays, Elevated Rack Guard takes advantage of existing storage rack framework to transform a contiguous run of open bays into a gated safety system.
